

ANALYTICAL TECHNIQUES, USED IN EXTRACTABLES TESTING

PDA TRAINING COURSE
EXTRACTABLES – LEACHABLES
VENICE
21 – 22 MARCH, 2019

Dr. Piet Christiaens

CHALLENGES IN E/L TESTING

Diversity of not-API Related Compounds in E/L research is Tremendous!!

Broad spectrum of:

- Types of Containers
- Types of Materials used in the Manufacture of Containers
- Number of Suppliers per Material
- Number of Grades (per supplier) for each type of Material
- Type of Sterilization (impact on material impurity profile)

Incomplete List of types of Pharmaceutical Containers and Components

INHALATION

- *Metered Dose Inhaler Components*

e.g.:

- Gaskets
- Stem
- Body
- Metering Chamber
- Protection Ring
- Actuator
- Canister

- *Dry Powder Inhaler Components*

- *Nasal Spray Systems*
- *Nasal Dropper Systems*
- *Blow-Fill Seal containers*
- *Nebulizers*
- ...

OPHTHALMIC

- *Eye Dropper Systems*
- *Tubes*
- *Blow-Fill-Seal containers*
- ...

PARENTERAL

- *Bottles*
- *Vials*
- *(Pre-Filled) Syringes*
- *Cartridges*
- *(Rubber) Stoppers*
- *Rubber Plungers*
- *Sealing Discs*
- *Needle Shields*
- *Tip Caps*
- *I.V. Bags*
- *Administration Sets*
- ...

DERMAL/TOPICAL

- *Spray Systems*
- *Tube systems*
- ...

SINGLE USE SYSTEMS

- *(Multilayer) Bags*
- *Tubings*
- *Connectors*
- *Ports*
- *Filters (+ Housing)*
- *Chromatographic Columns*
- *Lyo trays*
- ...

SECONDARY PACKAGING

- *Labels*
- *Adhesive/Glue (e.g. on labels)*
- *Ink*
- *Overwrap foils*
- *Blisters*
- *Cardboard packaging*
- ...

Challenges in E/L-Testing

Pharmaceutical Containers can be made of different Materials

- Low Density Polyethylene
- High Density Polyethylene
- Polypropylene
- Rubbers
- Butyl Rubbers
- Chlorobutyl Rubbers w/o Coating
- Bromobutyl Rubbers w/o Coating
- EPDM Rubbers
- Isoprene Rubbers
- Nitrile Rubbers
- Latex Rubbers
- Other Rubbers
- Multi-layer Films and Foils
- Polyurethane (PU)
- Ethylvinyl Acetate (EVA)
- Ethylvinyl Alcohol (EVOH)
- Polyamide (Nylon-6, Nylon-66)
- Cyclic Olefin Copolymers (COC)
- Cyclic Olefin Polymers (COP)
- Polyethylene Terephthalate (PET, PETG)
- Polybutylene Terephthalate (PBT)
- Polyacetal (POM)
- Polymethylmethacrylate (PMMA)
- Acrylonitrile Butadiene Styrene (ABS)
- Silicone
- Thermo Plastic Elastomers (TPE's)
- Polycarbonate
- PTFE
- PEEK
- Glass w/o Coating
- Metals
- ...

Challenges in E/L-Testing

Each Material has different Suppliers

EXAMPLES

Polyethylene - produced by:

- *Borealis*
- *LyondellBasell*
- *SABIC*
- *Dupont*
- *Enichem*
- *INEOS*
- *TOTAL*
- ...

Pharmaceutical Rubbers - main Global Suppliers:

- *Datwyler*
- *West Pharmaceutical*
- *Stelmi*

Each Supplier has different Different Grades!

Challenges in E/L-Testing

Each Supplier has different Different Grades

EXAMPLES

PolyEthylene - produced by:

- *Borealis: over 30 different Medical Grades*
- *LyondellBasell: over 30 different Medical Grades*
- *SABIC: over 30 different Medical Grades*
- *Dupont: different grades*
- *Enichem: different grades*
- *INEOS: different grades*
- *TOTAL: different grades*
- ...

Pharmaceutical Rubbers - main Global Suppliers:

- *Datwyler: over 100 different commercial rubber formulations*
- *West Pharmaceutical: over 100 different commercial rubber formulations*
- *Stelmi: also, a broad range of commercial rubber formulations*

Challenges in E/L-Testing

Per Material, Supplier and Grade: what makes up the Impurities Profile?

- Solvent residues (e.g. of Polymerization)
- Polymer residues (e.g. Monomers, Oligomers)
- Catalyst residues
- Polymer/Rubber Additives
 - Antioxidants
 - Photostabilizers
 - Plasticizers
 - Lubricants
 - Acid Scavengers
 - Antistatic agents
 - Pigments/Colorants
 - Carifying/Nucleating Agents
 - Cross Linking Agents (Rubbers)
 - Initiators (Rubbers)
 - Accelerators (Rubbers)
 - UV curing agents
- Polymer Additive Degradation & Reaction Products
- Polymer Degradation Compounds
- Adhesives
- ...

Conclusion:

1. The broad diversity of pharma containers, materials, suppliers and grades, leads to a extremely long list of potential impurities (leachables), introduced into the drug product
2. The compounds cannot be investigated with 1 analytical technique. Typically, at least 3 to 5 analytical techniques will need to be combined.
3. Compound Identification is of high importance, therefore the detection needs to be compound specific (e.g. MS-detection)
 - *Headspace GC/MS – Volatile Organic Compounds*
 - *GC/MS – Semi-Volatile Organic Compounds*
 - *LC/MS – Non-Volatile Organic Compounds*
 - *ICP – Metals*
 - *IC – Anions*

Challenges in E/L-Testing

Conclusion:

4. For Companies / Labs, only performing E/L-testing, every E/L-project could turn out into a high level research project (with the need for high level analytical techniques) because of the lack of materials knowledge
5. For Labs, performing E/L-studies on a routine basis, excessive analytical costs (associated with high-end analytical procedures) should be avoided in FIRST PASS testing.
eg NELSON's proprietary MS/RT Database, built from authentic standards (5000)

ANALYTICAL TECHNIQUES USED FOR EXTRACTABLES TESTING

SAMPLE PREPARATION:

*THE
MOST IMPORTANT &
THE MOST UNDERESTIMATED
ACTIVITY IN THE LAB!!!*

SAMPLE PREPARATION – CHALLENGES IN TRACE ANALYSIS

- Have **very experienced people** in Sample Preparation
- Very **Intensive Training** for new staff in Sample Prep
- **QC on solvents** used – select batches of clean solvents with suppliers
- **QC on extraction equipment**
- **Separate glassware**
- Precleaning of glassware – **validation of Cleaning Procedures**
- **Sampling of test articles** – how to handle Test Articles?
- **WFI sample prep** should be **separated** from solvent sample prep
- Correction for **absorbed solvents**?
- How to **concentrate extracts** – while avoiding cross contaminations
- **Storage of extracts** under controlled conditions
- **Holding times** of extracts
- Selection of **type of containers for storage** of extracts
- How to keep **DEHP** out of the Lab!

EXTRACTABLE STUDIES

IDENTIFICATION

IDENTIFICATION

IDENTIFICATION

CORRECT IDENTIFICATION

EXTRACTABLE STUDIES

A **Broad Identification** in “First Pass” Extractable Studies Requires:

1. A Compound Specific Detector: **Mass Spectrometry**
2. A **Database** to allow Identification based upon Mass Spectra
 - Commercial Databases for GC/MS: NIST, WILEY
 - Self-Developed Databases (e.g. NELSONS proprietary DB)
 - **PROBLEM for LC/MS**: no Commercial Databases Available!

Gass Chromatography / Mass Spectrometry (GC/MS)

Headspace GC/MS
(neat and after sample prep)

for Volatile Compounds

Direct Injection GC/MS
(after sample prep)

for Semi-Volatile Compounds

*However, the GC/MS part
of the Instrumentation is
the same for the two
techniques!!*

“Standard” GC/MS: Quadrupole M.S.

Gas Chromatography: Separation of Organic Molecules based on:

- Polarity – Interaction/Affinity with the Stationary Phase
- Boiling Point – GC-Oven temperature
- Film Thickness of the Chromatographic Capillary Column
 - *Volatile Compounds: high film thickness ($>1 \mu\text{m}$)*
 - *Semi-Volatile Compounds: low film thickness ($\leq 0.25 \mu\text{m}$)*
- Length of the Chromatographic Capillary Column
 - *Volatile Compounds: 30 m to 60 m*
 - *Semi-Volatile Compounds: 30 m*
- Polar Organic Compounds may need more specific conditions
 - *Acids, Amines, Alcohols....*

“Standard” GC/MS: Quadrupole M.S.

FIGURE 11-6 A quadrupole mass spectrometer.

General Sequence of Things in a Mass Spectrometer (GC):

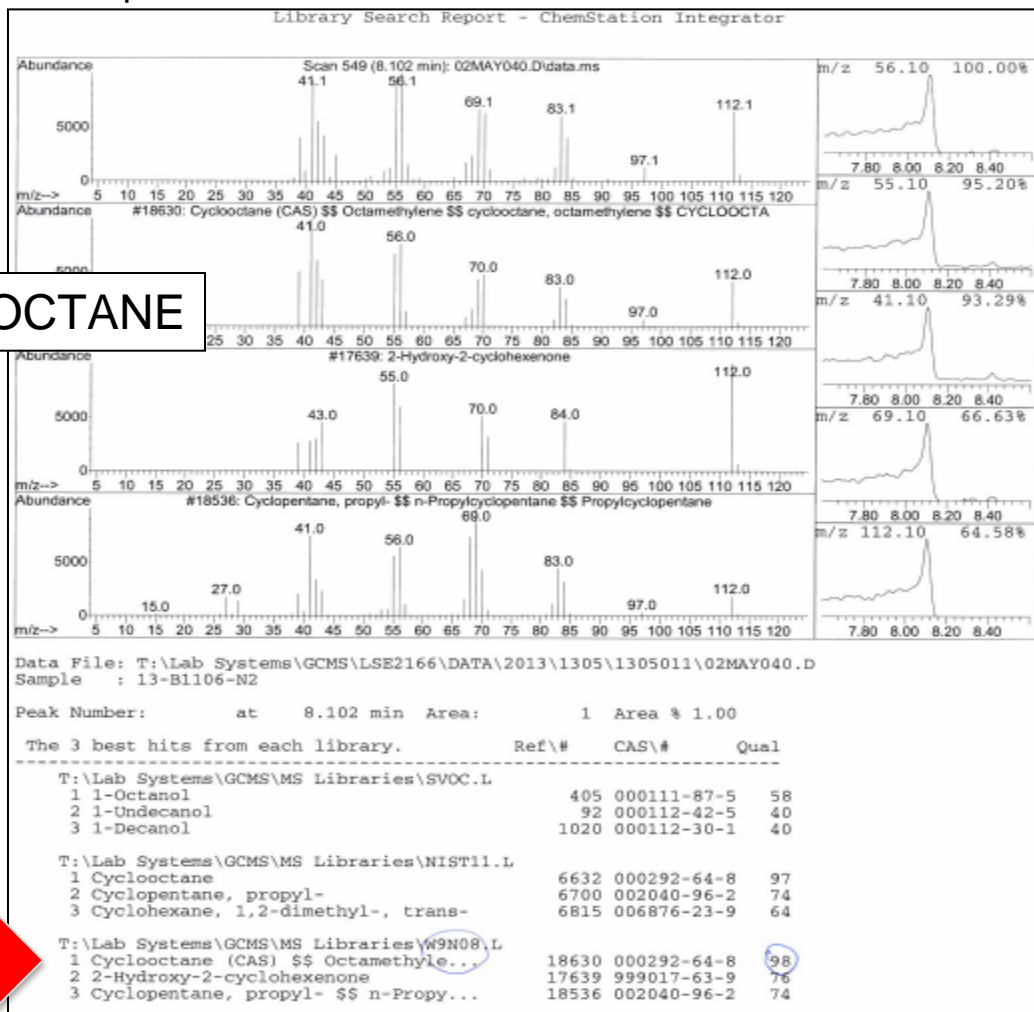

- High Vacuum
- Convert Molecules to Ions (Tungsten Filament)
- A Moving Ion (= charge) in a Magnetic Field gets deflected
- Only the right “m/z” can reach the detector and give a (charge) signal
- The charge signal is “strengthened” by a photomultiplier
- The Mass Filter (e.g. Quadrupole) scans a predefined mass range in milliseconds!
- This way, a complete mass spectrum can be obtained in a few milliseconds!

Standard GC/MS: Quadrupole M.S.

- A GC/MS “Mass Spectrometer” is **Standardized**:
 1. Quadrupole (or Ion Trap)
 2. Ionisation: Electron Impact Ionisation of 70 eV
 3. Gives Reproducible Mass Fragmentation:
Reproducible Mass Spectrum
 4. Mass Spectrum can be compared to commercially available Databases, such as NIST or WILEY – or self-developed MS-Databases (eg **TOX-RAY**)
 5. Can lead to Identification of Compound

Standard GC/MS: Quadrupole M.S.

Example of FIT of an UNKNOWN MS with NIST/WILEY

CYCLOOCTANE

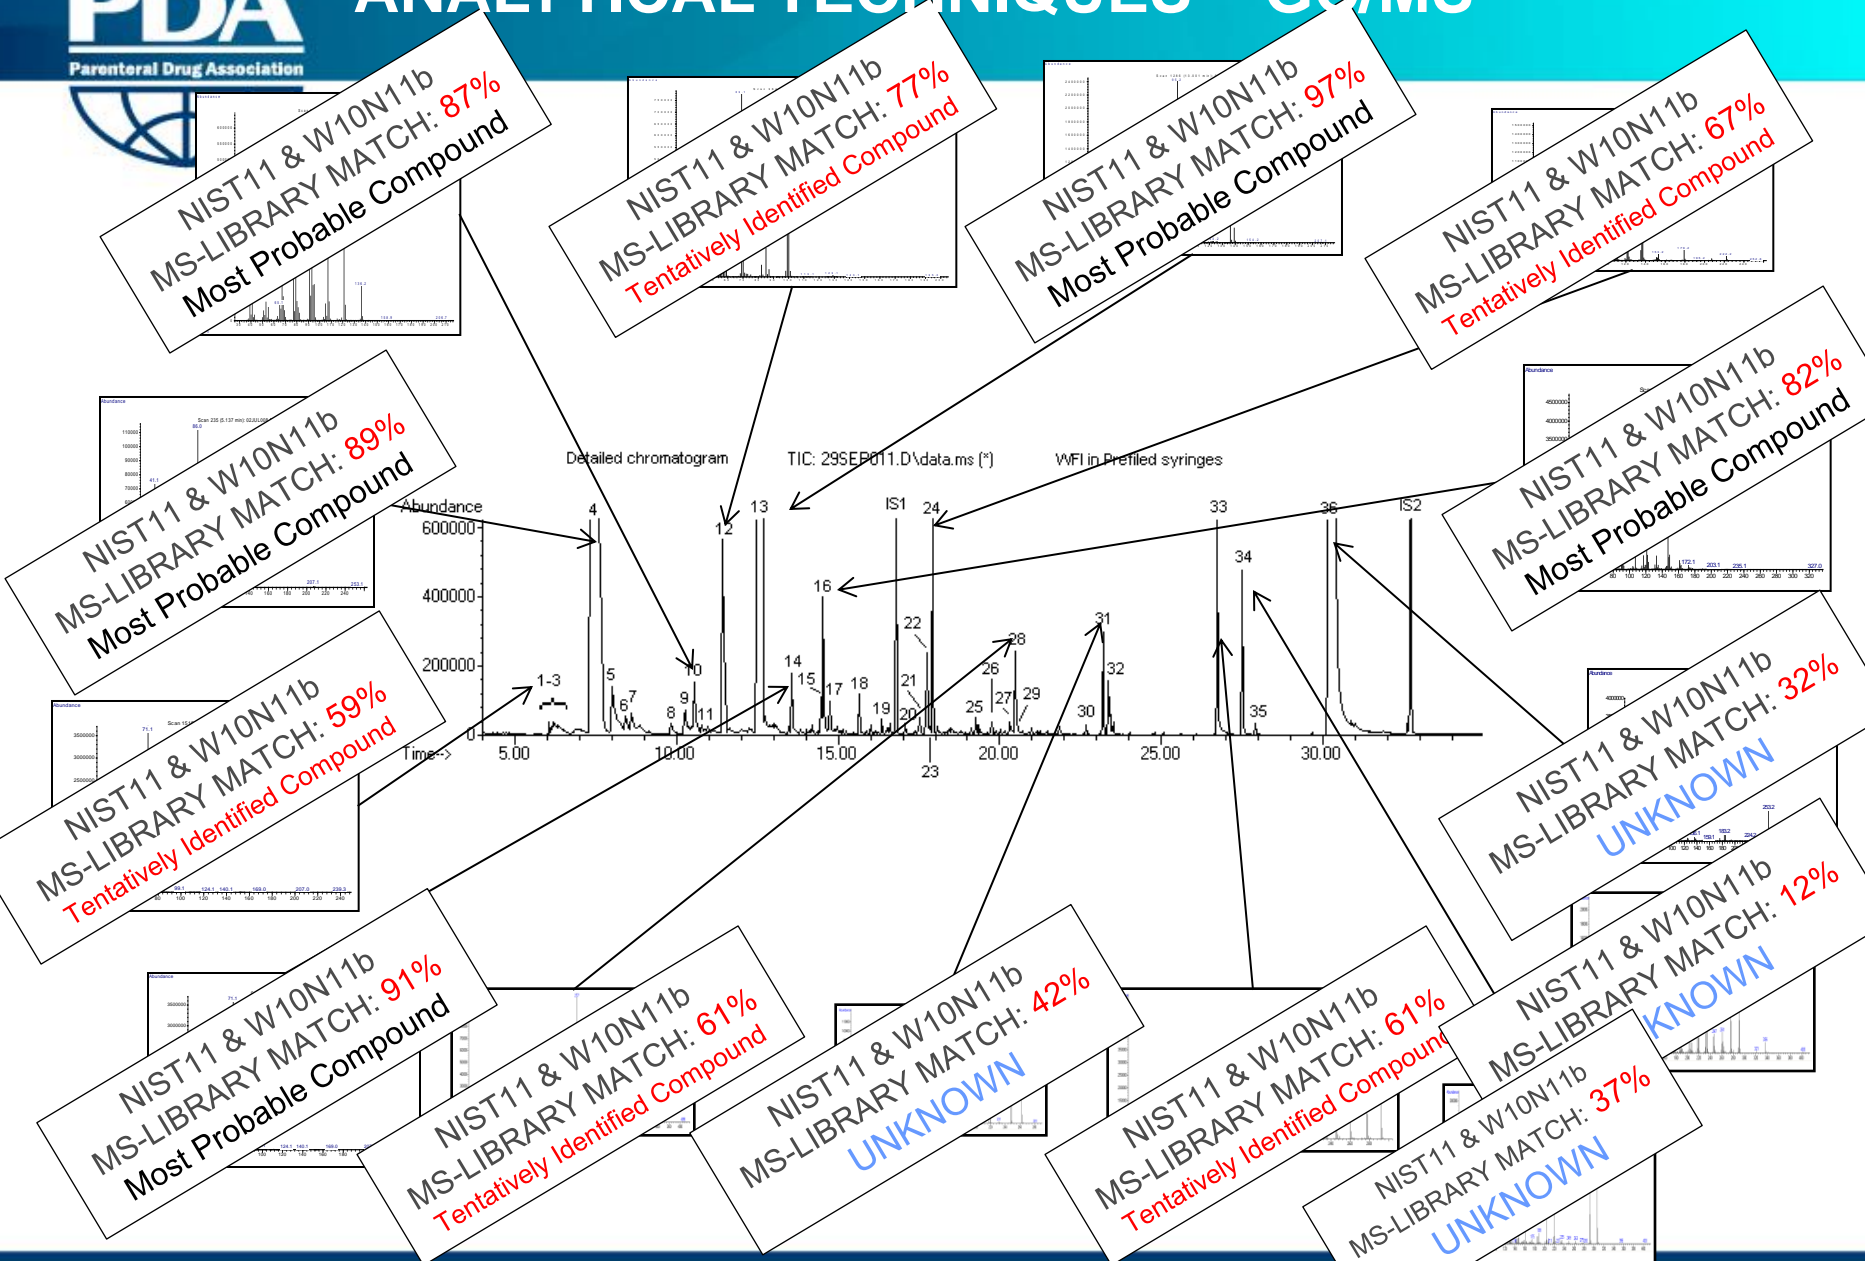

“Standard” GC/MS: Quadrupole M.S.

WHAT IS “SCREENING”?

- Trying to identify every single peak in a chromatogram
- Above a certain threshold
 - either Analytical (reporting threshold)
 - or Toxicological (e.g. AET)

Example: see next slide

VOC

HS-GC/MS
Screening

Volatile Organic Compounds (typically MW < 200)

- **Monomer Residues**
- **Solvent Residues from Production steps**
- **Residues from polymer treatments (e.g. Washing)**
- **Small Polymer Breakdown products**

VOC

SVOC

HS-
GC/MS
Screening

GC/MS
Screening

Semi-Volatile Organic Compounds (MW < 650)

- Lubricants
- Plasticizers
- Antioxidants
- Polymer degradation products
- Solvents with an elevated boiling point

Derivatisation GC/MS

- A combined Headspace-GC/MS, GC/MS and LC/MS approach is suited for a broad list of organic compounds.
- However, compounds containing functional groups such as: ***Organic acids, Amines, alcohols, polyols, aldehydes, ketones...*** may not always be very sensitive in regular GC/MS analysis!!
- A Derivatisation Method is using BSTFA as derivatisation agent (*conversion to more volatile, less polar trimethylsilyl esters*).

DERIVATISATION GC/MS: EXAMPLES

Peak 1: Palmitic acid

Trimethylsilyl ester
of Palmitic Acid

Peak 2: Terephthalic acid

Trimethylsilyl ester
of Terephthalic Acid

DERIVATISATION GC/MS: RESULTS

Other GC/MS Techniques (*High-End GC/MS*)

GC-MS (C.I.): Chemical Ionisation GC/MS

- “Soft Ionization” Compared to Electron Impact (E.I. 70eV)
- The molecule is less Fragmented
- Detection of Molecular Ion
- Allows to determine the Molecular Mass (i.e. With GC-ToF)
- Can be used for “Second Pass” Identifications

GC-QQQ or GC-“Triple Quad” Mass Spectrometer

- **Targeted** analysis in complex matrices
- Very low Detection Limits in complex matrices due to elimination of matrix interferences

Other GC/MS Techniques

GC-(Q)-ToF or GC-“Time-of-Flight” Mass Spectrometer

- **Accurate Mass Measurements**: what does it bring?
- Principle: Every Atom has a specific Atomic Weight
 - C = 12,00000
 - H = 1,00794
 - O = 15,9994
 - N = 14,0067
 - ...
- Look for the best combination of Atoms which will fit the Accurate Mass the best, Measured with GC-ToF.

GC-TOF Accurate Mass Measurements

Example: a Compound - Accurate Molecular Mass of 136.05243 - was detected.

What could be the Elemental Formula? Using a CALCULATOR

Specify the mass

Accurate mass experimental result:

Results:

MF	Monoisotopic mass	PPM	mDa	unsaturation
1 C ₈ H ₈ O ₂	136.0524295014	0.004	0	5
2 C ₃ H ₇ FN ₃ O ₂	136.0522296921	1.472	-0.2	1.5
3 C ₅ H ₁₁ ClNO	136.0529166949	3.577	0.487	0.5
4 CH ₈ N ₆ S	136.0531149801	5.035	0.685	1
5 C ₃ H ₉ CIN ₄	136.0515740244	6.292	-0.856	1

Most Probably, the Elemental Formula of this molecule is C₈H₈O₂

Cross Examining results of other Analytical results, revealed that this compound is **4-methylbenzoic acid**

However, this conclusion cannot be drawn, based solely on accurate mass!

Other GC/MS Techniques

- **GC-ToF** or GC-“Time-of-Flight” Mass Spectrometer
 - For extracts with a lot of “Unknown” compounds, the extracts are analyzed with GC-(Q) ToF (in E.I. and C.I. Mode) in order to determine the
 1. **Molecular Ion and hence the Elemental Composition (CI and/or EI)**
 2. **Fragment information (EI)**
 3. In combination with existing data, determine more about the **Structure and Source** of the compound
 4. In some cases, in combination with **Derivatization Procedure**
 5. In some cases, a **full identification** of the compound

However: Overlap with compounds from GC/MS (*Volatile & Semi-Volatile Compounds*)

The principle of HPLC

- High Pressure
- Separation, mostly reverse phase chromatography
- Optimizing separations by
 - Selection of Chromatographic Column (Polarity, Length...)
 - Selection of the Elution Solution (WFI, MeOH, ACN...)
- Detection of the Compounds (UV: DAD; Mass Detection)

Screening

Non-Volatile Organic Compounds

- **Fillers**
- **Plasticizers**
- **Antioxidants**
- **Anti-slip agents**
- ...

HPLC - UV

Advantages

- Standard Equipment in a Lab
- Low Cost
- UV-Detector can be a *nice addition* to other Detectors, e.g. MS

Disadvantages

- Not a Universal Detector (Target Molecules need Chromophores)
- Non specific
- Not very Sensitive
- Information about the Detected Molecule is limited
 - E.g. Is the molecule linked to the API?

LC-MS

Advantages

- Specificity
- Sensitivity
- More can be said about the Identity of the Compound
- Quality of Information HRAM > Low Resolution
- Allows to build Databases for Identification

Disadvantages

- Cost
- Not a Universal Detector (Target Molecules need to Ionize)
- However, different Ionisation Modes allow a broader detection of Compounds (APCI+/-; ESI+/-)

LC-MS

**Older systems:
LOW Resolution Mass
spectrometer**

Ion Trap/Single Quad

Accuracy of Mass Detection is poor: 1 Dalton

m/z 220 can be distinguished from 221

HIGH Resolution LC-MS (LC-HRAM)

Orbitrap/Time-of-Flight (ToF)

Accuracy of Mass Detection - Orbitrap:

Mass error : sub ppm

m/z 220,2456 can be distinguished from m/z 220,2457

MAJOR ADVANTAGES!

- » **Robust:** accurate mass is independent of the system
- » High Accuracy in mass detection allows **elemental composition** analysis of an unknown analyte
- » Extremely **powerfull if coupled to a UPLC**
- » **Building specificity into your databases based on mass accuracy and retention time!**

LC-ION TRAP (LOW MASS ACCURACY)

LOW RESOLUTION MASS

No information

LC-ORBITRAP (HIGH MASS ACCURACY)

HIGH RESOLUTION ACCURATE MASS

$C_{11}H_{14}O_2$ exact monoisotopic mass: 179.10666

Mass error:

1 ppm

Peroxide curative related

Ion Chromatography:

- PolyOlefins (e.g. After Irradiation/Ageing): Acetate & Formate
- Halobutyl Rubbers: Bromide, Chloride, Fluoride
- Other trace impurities: Nitrite, Nitrate, Phosphate, Sulphate
- Example: Halobutyl rubbers may contain traces of bromide or chloride ions, either from side-products generated during the halogenation step, or rubber degradation products, or impurities. Additionally, fluoride may be released from fluoropolymer coatings

Sample: reflux extract with WFI (water for injection) of a halobutyl rubber

OTHER SPECIFIC METHODS

- ✓ **GF-AAS** For Silicone Oil Detection
- ✓ **ESI-UPLC-HRAM (Electron Spray: BPOG Method)**
- ✓ **HPLC-UV** for TMPTMA (glue residue)
- ✓ HPLC-UV for S₈ (Cross Linker)
- ✓ **pH** (release of acidic/alkalinic agents in UPW)
- ✓ **Conductivity** (release of salts in UPW)
- ✓ **Non-Volatile Residue** (gravimetric residue)
- ✓ **FTIR** – characterization of NVR
- ✓ **Total Organic Carbon: *reconciliation with concentration of organic compounds from chromatographic techniques***
- ✓ ...

ANALYTICAL TECHNIQUES USED FOR LEACHABLES TESTING

LEACHABLES STUDIES

TECHNIQUES USED IN LEACHABLE STUDIES

- ✓ Headspace GC/MS: Volatile Compounds
- ✓ Direct Injection GC/MS: Semi-Volatile Compounds
- ✓ D.I. GC-QQQ: Semi-Volatile Compounds
- ✓ LC-QQQ: Non-Volatile Compounds
- ✓ Ion Chromatography: (An)Ions
- ✓ ICP-OES or ICP-MS: Metals

Specific Analysis/Techniques for specific target analyses...
