

Particle Characterization and Identification

Markus Lankers, PhD September 2019

Connecting People, Science and Regulation

1

Root cause, particle characterization

Investigation regarding the metal particulate contamination in lots was inadequateThe atypical contamination found in these lots was metal, however, the batches were not rejected. Additionally, there was **no investigation** conducted to determine the cause of the black metal particulates found in these lots

"reported a particle identified in a vial during an AQL inspection. There was no documentation on the identity of the particle and whether it was inherent or foreign (black debris, fiber, glass fragments, etc.)." 2015

Reasons for Particle ID

3

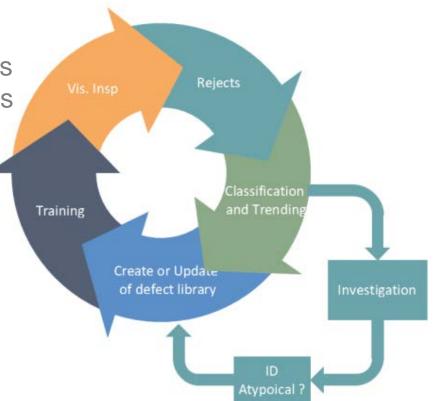

- 1. Classifcation and Trending
- 2. Root cause analysis
- 3. Manufacturing Process Continuous Process Improvement

Visual Inspection Lifecycle

 Use the Trending Data from Reject Characterization and Monitoring

PDA

- Review the various particulate sources for Process Improvement opportunities
- Focus on the most predominant particle types
- Repeat the Cycle of Monitoring, Trending, Corrective actions and follow-up Monitoring

Classification and Trending

Connecting People, Science and Regulation

Level One: Visual classification (in-Situ)

- Nondestructive, as seen during manual inspection
- Light, dark, sinking, floating, color, shape, etc.

Level Two: Macroscopic and Microscopic

- Rapid characterization to specific material categories
- Metallic, glass, rubber, plastic, fiber (natural or synthetic), silicone lubricant, inherent particles, etc.

Level Three: Spectroscopic or other fingerprint ID

• FTIR, Raman, Elemental, Mass Spec, etc.

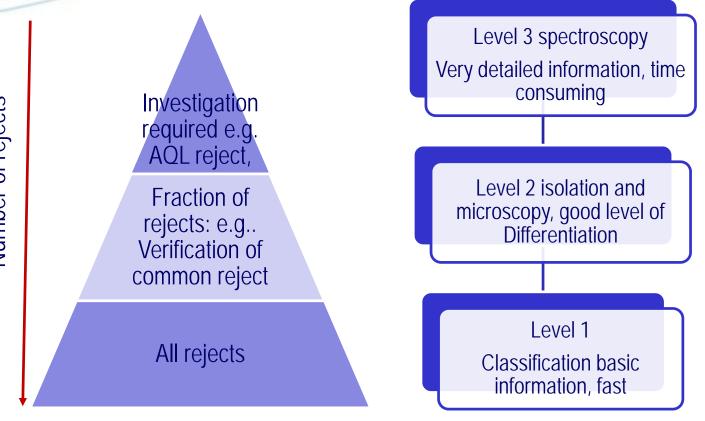

Roy Cherris Visual Inspection Forum 2013, Bethesda

When do I need which kind of information ?

Connecting People, Science and Regulation

Comparison of Characterization Level

| Level | | Cost | time/particle |
|-------|--|--|---------------|
| 1 | light microscopy | Invest: 2T€ € | 15 min |
| 2 | Isolation, Polarized Light microscopy | Invest: 60 T€ | 30 min |
| 3 | SEM / Raman/ IR | Invest: 70 T€ (IR), 150 T€ (Raman), 180 T€ (SEM) | 30 min |

Classification Level 1

- Classification is based on basic observations Defined by trajectory, shape, density
- 2. Classification could be done by a experienced operator probably trained for special tools
- 3. Reason to go on with level 2 characterization could be statistics, uncertainty about nature of the particle

Categories / Attributes

Categories

| Category | | Category | |
|---------------|-----|----------------|----|
| Glass-Like | [] | Polymeric-like | [] |
| Metallic-like | [] | Dark Particle | [] |
| Fiber-like | [] | Light Particle | [] |

Attributes for further description

| Shape | Colour | Location | Density | Size |
|-----------|-------------|----------|---------|------|
| Spherical | Light | Body | Floater | |
| Irregular | Dark | Bottom | Fixed | |
| Elongated | Transparent | Shoulder | | |

Microscopic investigation – Level 2

11

Level 1 characterization groups e.g. dark particle, light particles, fiber-like might be sampled by a basic universal sampling plan like $\sqrt{N+1}$

Isolation is required for further investigation Clean area mandatory:

- clean room, clean bench, ultra cleaned glassware, requires trained personnel
- Various tools for isolation:
- Capillary, tungsten needles, filtration

Microscope helps to give further details:

• Rubber, metal, synthetic vs natural fiber, crystal shape, color After isolation particle can be easily transferred to level three

Microscopic information – Level 2 ₁₂

| Incident Light | Select | Transmitted Light | Select | Level II Category | Select | Level II Category |
|------------------|--------|------------------------|--------|-------------------|--------|-----------------------|
| Clear | [] | Transparent | [] | Glass | [] | Polymeric |
| Opaque | [] | Opaque | [] | Metallic | [] | Rubber Stopper |
| Reflective | [] | Crystalline | [] | Fiber | [] | Semi-Solid - Silicone |
| Physical | Select | Crossed Polars | Select | Fiber - Natural | [] | Possible Inherent API |
| Crystalline | [] | Isotropic | [] | Fiber - Synthetic | [] | Possible Extrinsic |
| Shaving | [] | Anisotropic | [] | | | |

PDA

Trending

Spectroscopy Level 3

| method | meaning | time/particle |
|--|-------------------------------------|---------------|
| PLM (polarized light microscopy) | color + shape e.g.: black fibres | 1-5 min |
| SEM/EDS analysis | > 5µm Elements | 20-180 min |
| IR – microscopy | > 50 µm Structure | 20-180 min |
| RAMAN - microscopy | > 0.5 µm Structure | 20-180 min |

Connecting People, Science and Regulation®

Fiber – Level 1

| Category | Select | | |
|---------------|--------|--|--|
| Glass-Like | [] | | |
| Metallic-like | [] | | |
| Fiber-like | [X] | | |

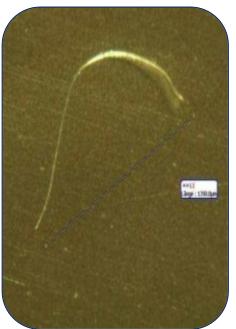

| Category | Select | | |
|----------------|--------|--|--|
| Polymeric-like | [] | | |
| Dark Particle | [] | | |
| Light Particle | [x] | | |

- Fibers can be easily classified. Might be sufficient for trending
- Further classification of fibers can be preformed in situ with an inverted microscope due to morphology and texture

Fiber-Level 2: Isolation Microscopy₁₆

- Microscopy of isolated fiber gives further information (cotton, protein based fiber, synthetic)
- Spectroscopy can give a very specific fingerprint for root cause or kind if synthetic fiber

Level 1

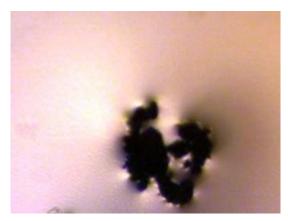

Connecting People, Science and Regulation

Level 2

Metal particle Level 1 and Level 2 17

- Characterized density and reflectivity
- Sufficient for trending
- Hard to observe while swirling
- Usually easy to find at the bottom

Level 1

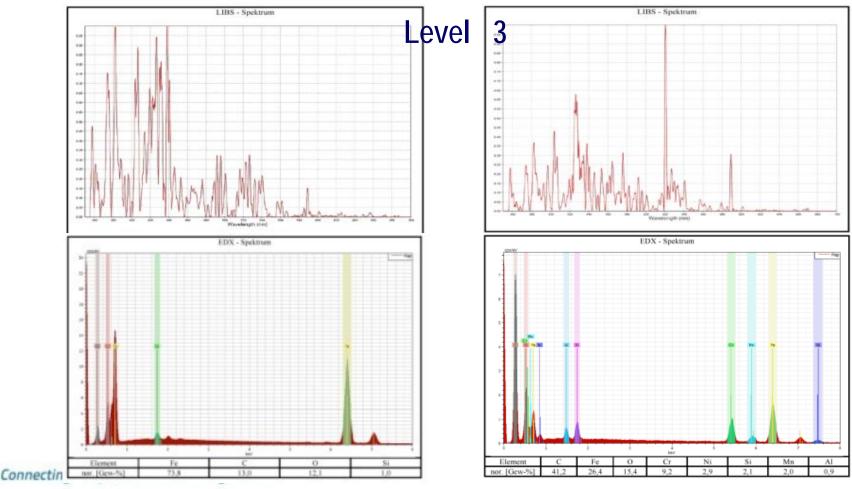

Level 2

Level 2

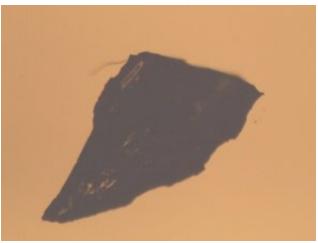

Spectroscopy on metals – Level 3 18

Spectroscopy gives more detailed information on the kind of steel e.g. low alloyed vs high alloyed steel which might be needed for root cause investigation

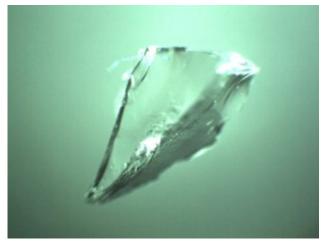

Glass particle - Level 1 and Level 2

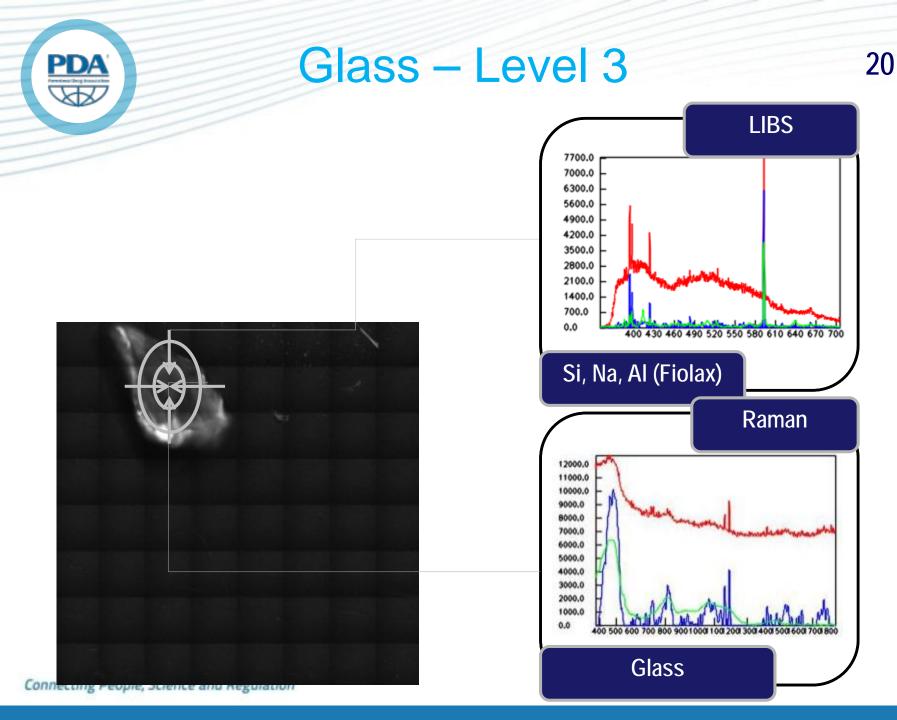

- Glass has a very characteristic shape which is sufficient for classification
- Further characterization for root cause investigation: element specific methods e.g. SEM or LIBS favorable

Level 1

Level 2

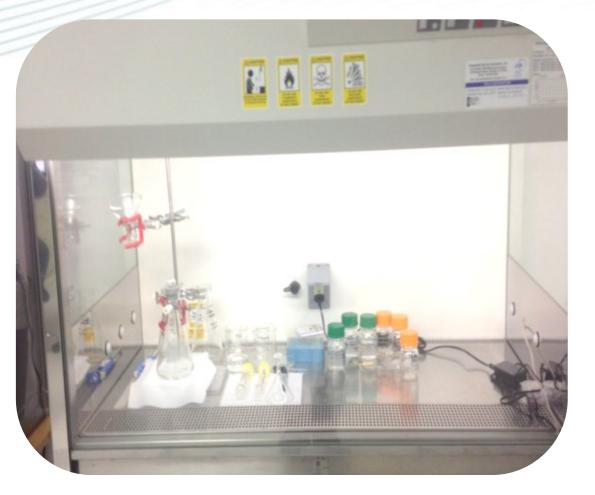

Particle Isolation

Connecting People, Science and Regulation®

Isolation

Environmental Considerations

- Class 100 clean bench is essential
- "Ball-park" clean rooms would be beneficial
- Cleaning is essential and system suitability tests (blanks) have to be taken
- Training and control is essential
- Benches, coats, sleeves, microscopes, equipment and water should be clean and non-shedding

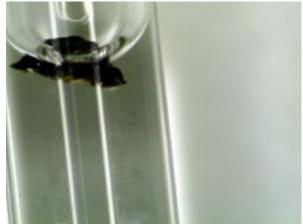

Isolation and transportation

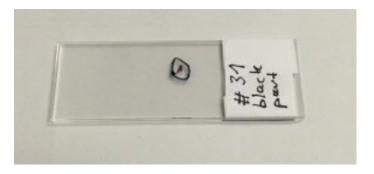

Tungsten needles for particle picking

Capillary trapping

Sending particles to a lab between 2 slides

Particle Sources

Connecting People, Science and Regulation®

Particulate Matter vs. Foreign Matter

26

Inherent

Particulate made entirely of components of the formulated product, arising from the product itself. These particulates are related to the product formulation: API

Intrinsic

Particulate related to the production process of components of the formulated product, arising from the product itself. Processing Equipment, Primary Package, Active and other ingredients

Extrinsic (Foreign)

Environmental Contaminants insect parts, hair, fibers, paint, rust

PDA

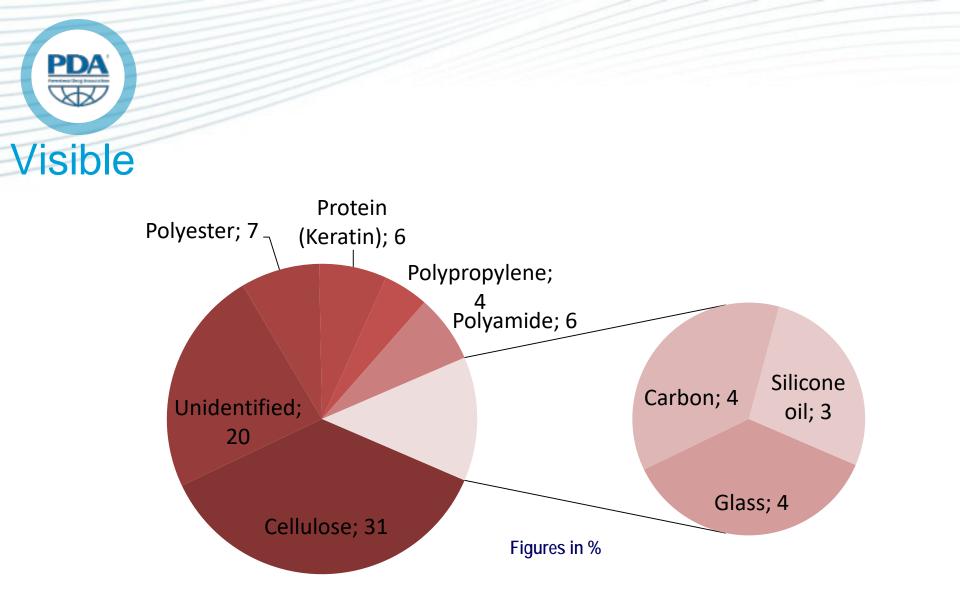

- Garnement
- Water
- container

27

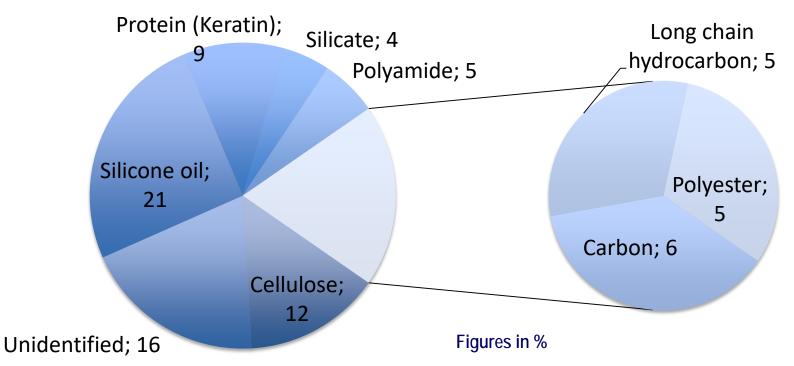

- Process / Production
 Equipment
 e.g.: rubber
- Cleaning process

Cellulose, Polyester and Protein/Polyamide particles are major contributions to particulate contamination.

Sub-visible

Silicone oil, Protein, Cellulose particles are the most often found contaminants

- Cellulose: mostly fibres
 - source: clothes, towels, wipers, autoclave paper

Longchain hydrocarbon
 – source: rubber (stopper), PE (bottles)

Top Ten in more detail

- Glass: fibres and particles
 - Source: Primary packaging
 - But also glassfibers and hollow glass fibres (filter material)
- Carbon: particles
 - Usally black particles contain high content of carbon:
 - Sealings rubber material filled with carbon
 - Burned material

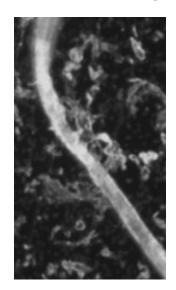

31

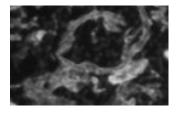

Top Ten in more detail

- Polyester: fibres and particles
 - Source: Cleanroom clothes and defect filter
- Protein: mostly flakes
 - Source human dust, protein particles from protein solution
- Silicone oil: compact particles
 - Source: sealings, siliconisation

32

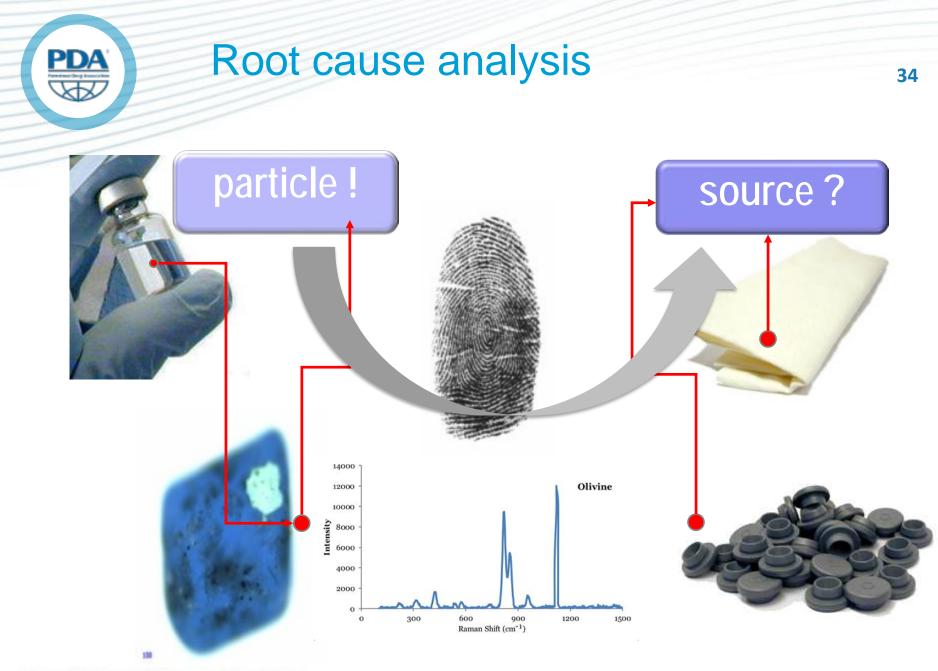

Plunger/stopper related defects

- White or black spots on/between lips
- Foreign material trapped between plunger and glass wall Glass bits
- Rubber chunks
- Fibres
- Hair

Connecting People, Science and Regulation®

Particle investigation

- Documentation of the defect →in-situ (in the closed container)
- 2. Filtration and documentation of the sample on the membrane filter
- 3. Documentation of the analysis and the identification of the reject by Raman spectroscopy
- 4. Identification of sub-visible to gather further information
- 5. Verification of the findings (particle observed by visible inspection) with FT-IR or LIBS, EDX

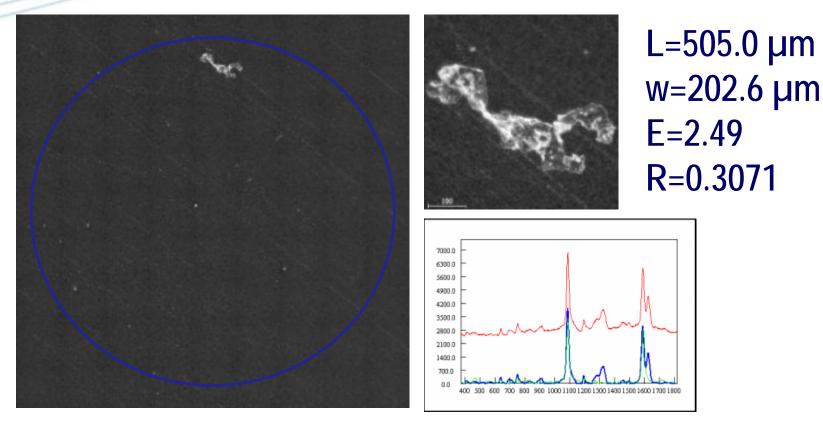

Connecting People, Science and Regulation®

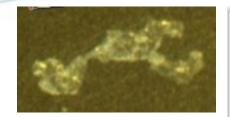

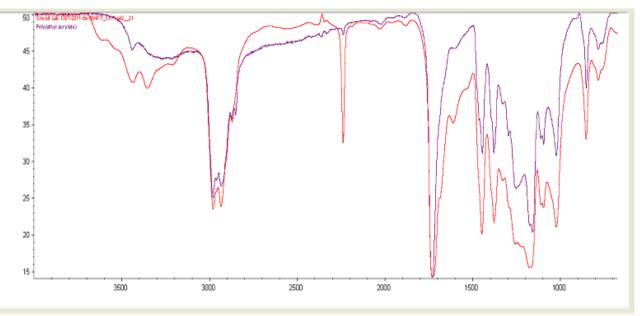

3. Particle Imaging + raman.ID

Raman.ID: Polyethylene-terephtalate, PET Rank: 887

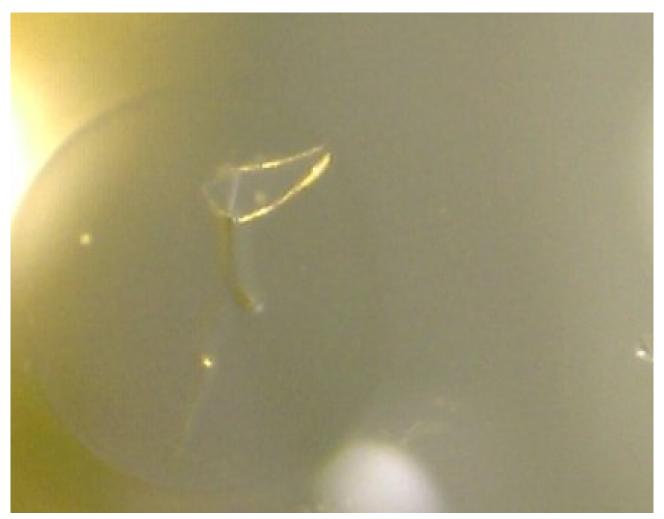

4. Verification FT-IR → PET

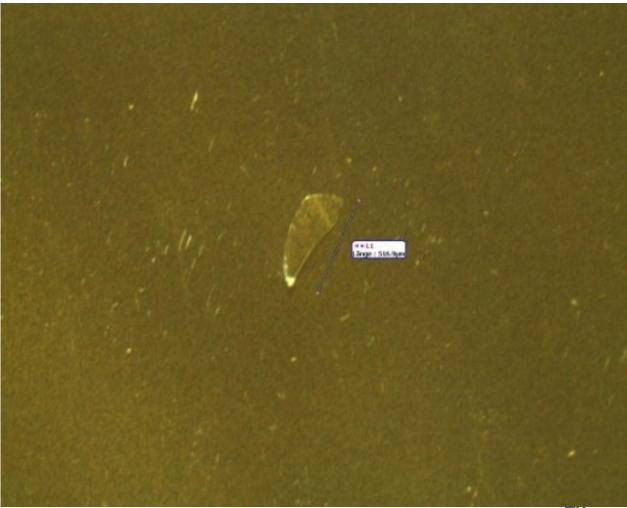

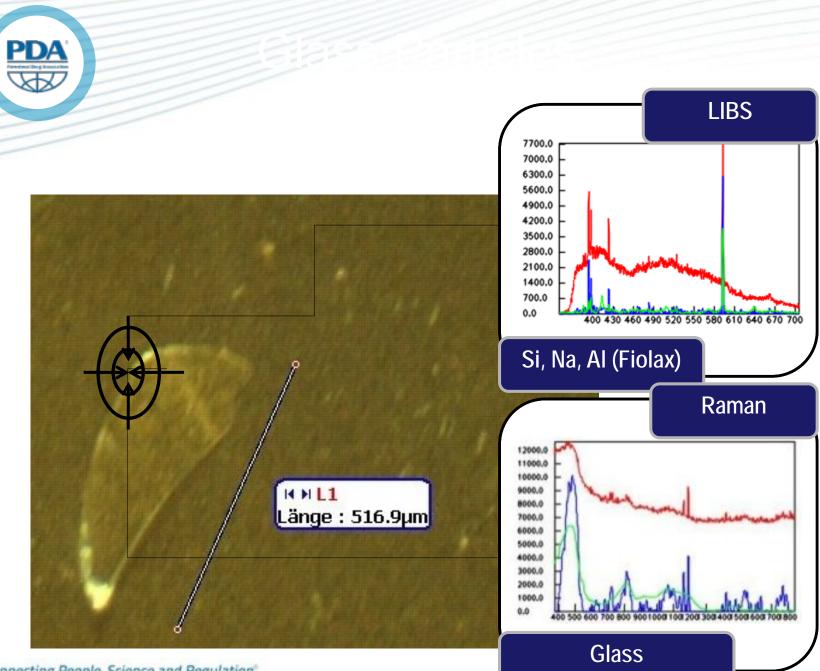

Polyethylene Terephtalate, PET 76.16% matching

Report II - Summary

- The largest Particle we observed in the vial (516 µm) was identified by means of Raman as well as FT-IR spectroscopy as glass.
- This finding was also confirmed by LIBS Laser induced brakdown spectroscopy. The particle matched with Fiolax (Al is a marker).

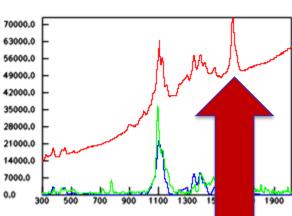

CELLULOSE SOURCE

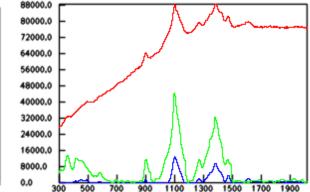

Example Cellulose Source

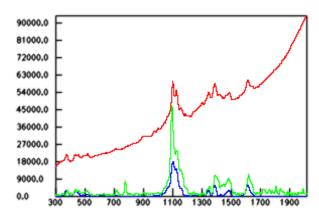

- 1. 4 batches failed in a row
- 3 samples of each of the failed batches and one of the good batches were investigated
- 3. Soon it became clear that the problem was cellulose related....

Several cellulose fibers were found

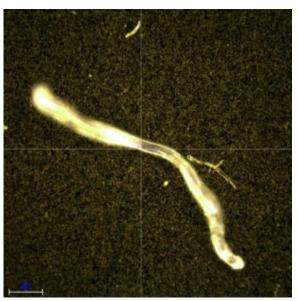

PDA

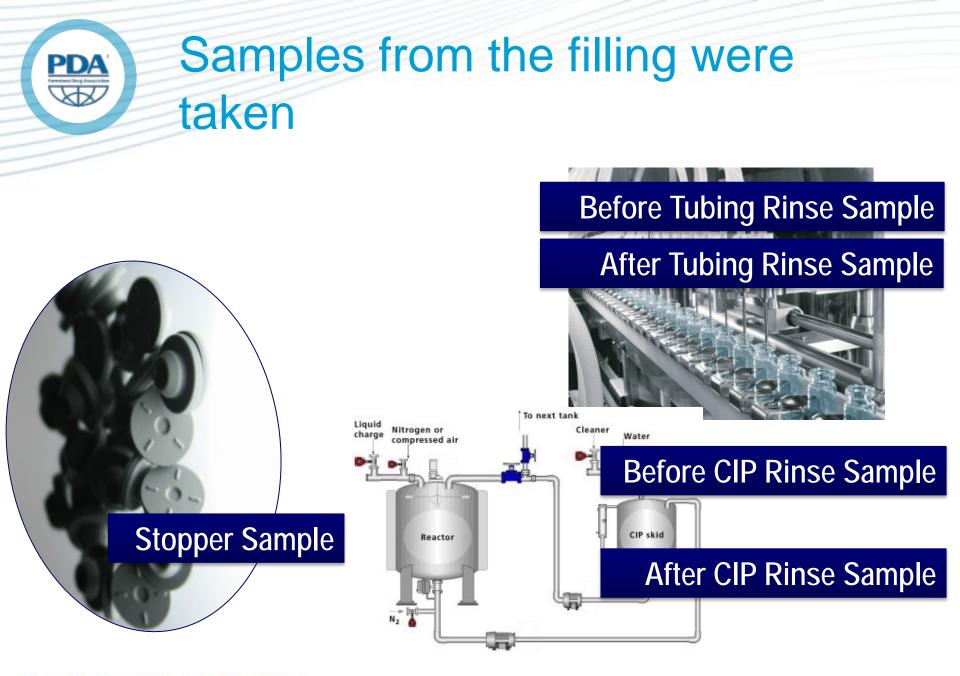

Cellulose (Contaminant)

Samples from the process were taken

Before Tubing Rinse Sample

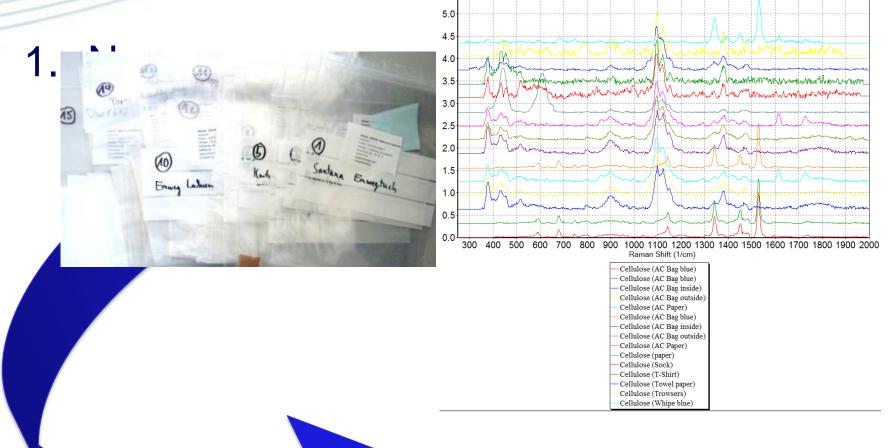

After Tubing Rinse Sample

Before CIP Rinse Sample

After CIP Rinse Sample

Stopper Sample

Database with filling line related materials was built

No Cellulose (Contaminant) !

Update of the library with towels used in API production

PD/

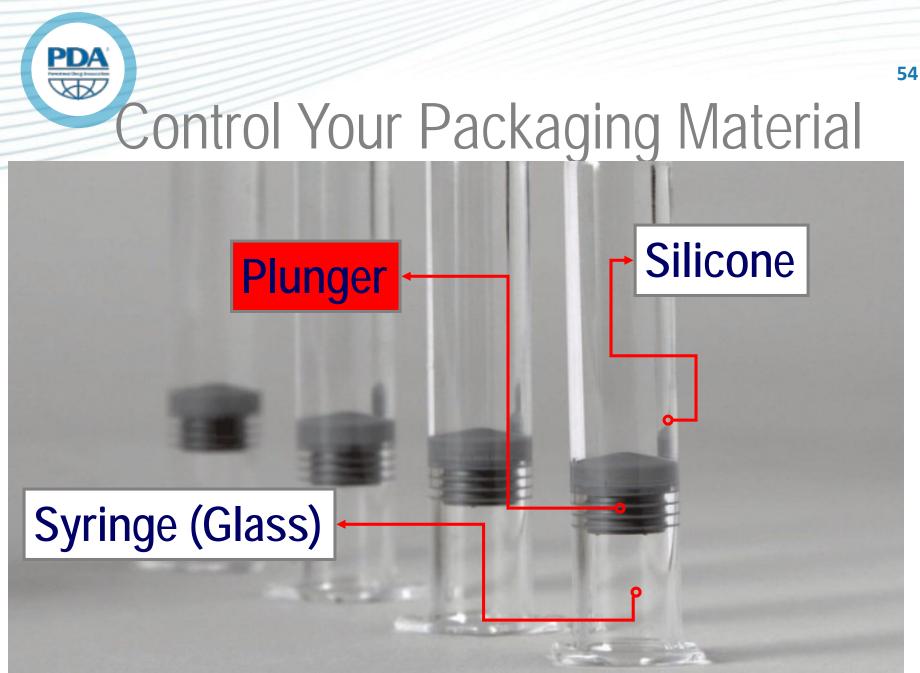

Cellulose (Contaminant)

Conclusion Cellulose Example

- 1. One special type of cellulose could be identified by the typical peak @ 1600
- 2. Database was built with suspect cellulose samples used in production
- 3. These Cellulose (contamination) fibers were found in smaller concentration in CIP rinses no fibers ...were found in the process prior to filling!
- 4. Samples from API tanks and tubings showed this type of fiber.

→ API manufacturer used paper towels and introduced cellulose into the process

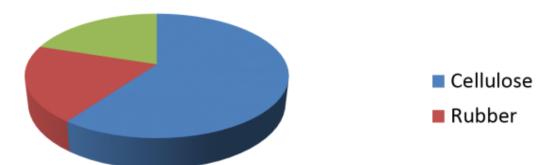

Fibers and particles on rubber

- 10 stoppers contaminated with fiber Cleaning following ISO 8871
- 51 particles > 50 µm found

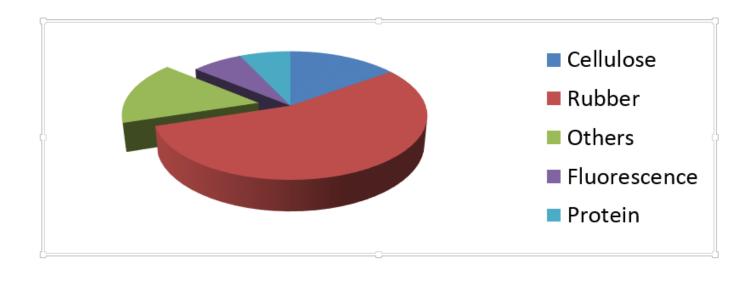

Large scattering in particle number and composition can be observed in one batch and different bags

Fibers and particles on rubber

- 10 stoppers contaminated with particles Cleaning following ISO 8871
- 144 particles found > 50 µm

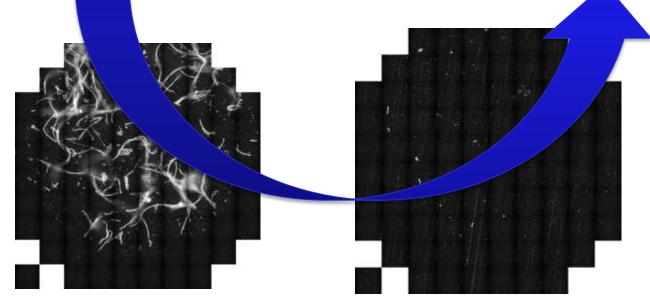

Stopper Bags have an impact or reflect stopper quality

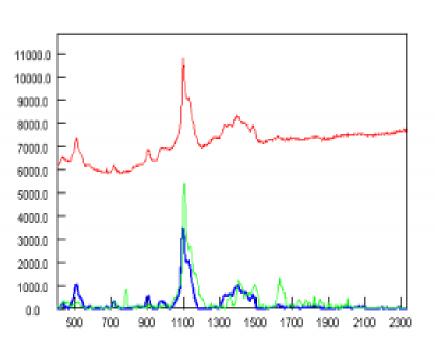

Test Procedure: Bag rinsed with 250 ml water / SDS, filtration, counting

Fibres collected from one bag; 375 particles > 25 µm Connecting People, Science and Regulation

Fibres collected from one bag; 45 particles > 25 µm

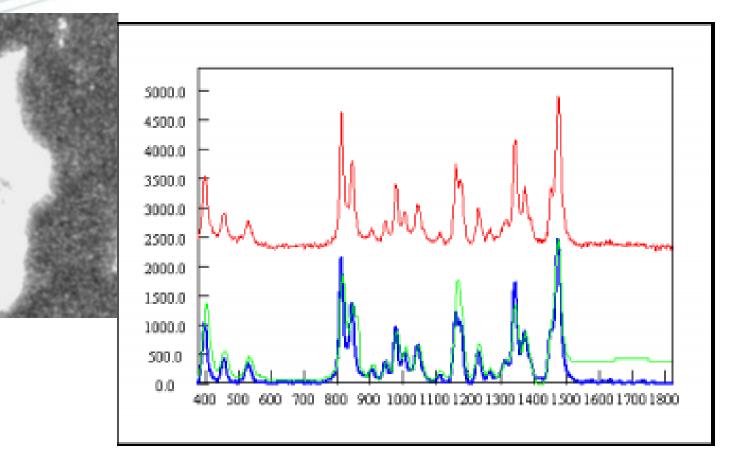

RESULT: Cellulose [Paper] RANK: 882, S/N: 39.2

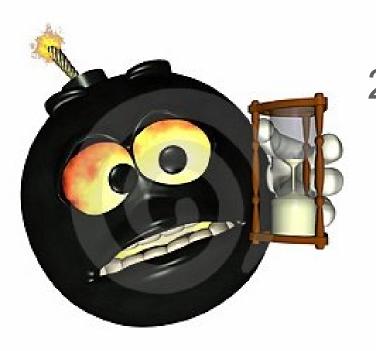

Particles → **Rubber**

RESULT: Rubber, RANK: 974, S/N: 30.3

Time bombs

- 1. Increase of rejects with time
- 2. Chemical reactions taking some time
 - Silicone oil on stoppers: Agglomeration of Proteins
 - Coatings
 - Glass delamination

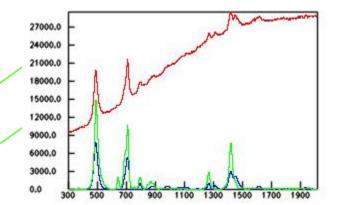

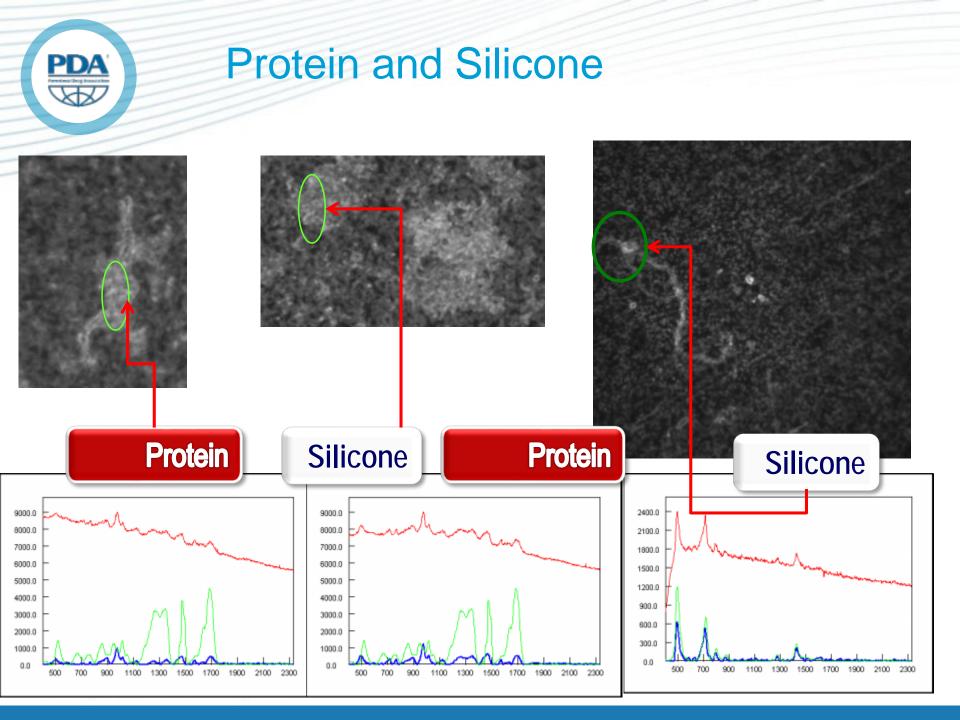

Turbidity / Haziness

Observation of haziness and aggregates in a new a new batch after slight process change

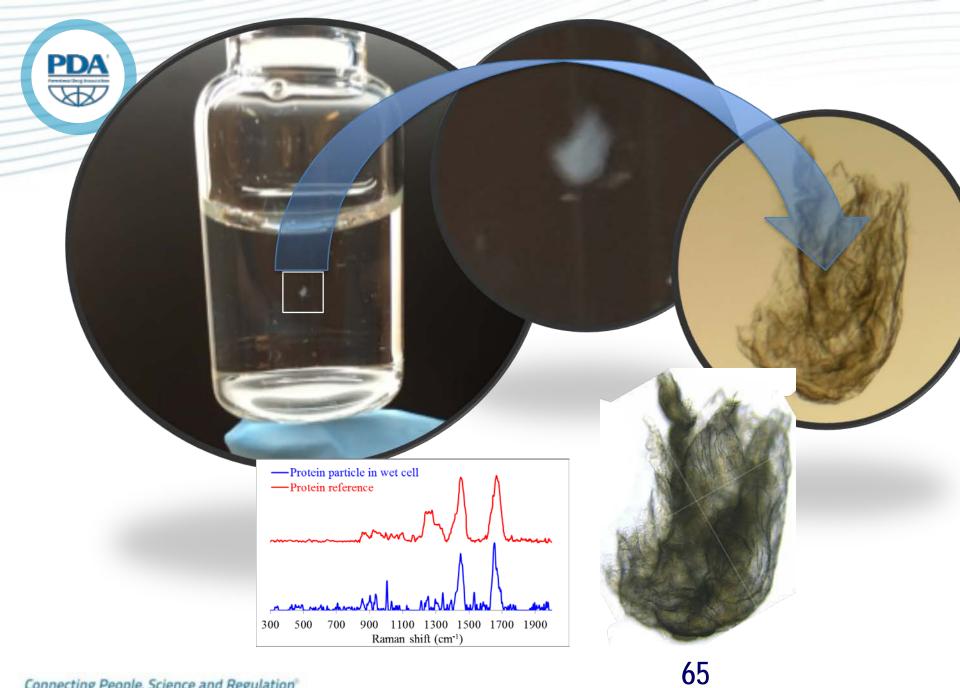

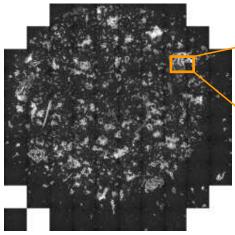

VISIBLE INHERENT PARTICLE

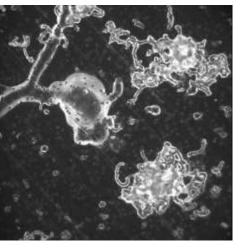

Coating

Increasing number of rejects in visual inspection with time

Supplemental Testing or Inspection

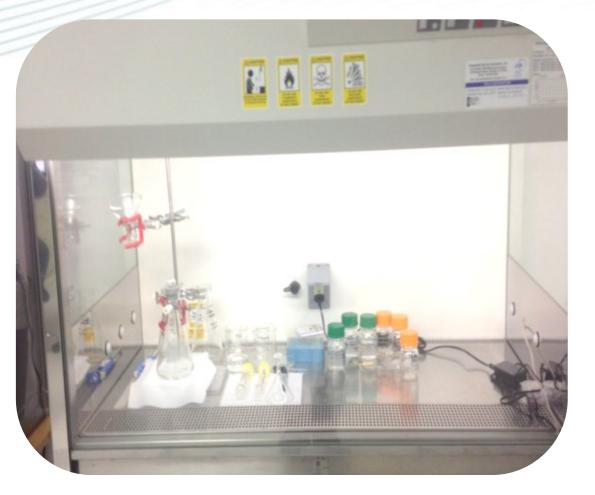

67

Destructive reconstitution, dilution, transfer, clearing, solubilizing, filtration, screening, or sieving that mallows a product to be visually examined or evaluated microscopically to determine the presence, type, and size of foreign particulate contamination present within the product, container, or device.

Destructive Inspection and Test Methods

- Reconstitution
- Filtration
- Clarification
- Transfer Dilution
- Sieve/Mesh
- Panning
- Rinse/Flush and Filtration

Isolation

Environmental Considerations

- Class 100 clean bench is essential
- "Ball-park" clean rooms would be beneficial
- Cleaning is essential and system suitability tests (blanks) have to be taken
- Training and control is essential
- Benches, coats, sleeves, microscopes, equipment and water should be clean and non-shedding
